SCHOOL OF ENGINEERING AND TECHNOLOGY
ICT461 – UNIT II LAB ASSIGNMENT

Course Registration Interface – Lab Report

STUDENT NAME: JENNIPHER MWENGE
STUDENT ID: 202301743
COURSE NAME: WEB SYSTEM AND TECHNOLOGY
COURSE CODE: ICT 461
LECTURER: Mr NYIRENDA
PROGRAMME: computer science
DATE: 17 September 2026

1. INTRODUCTION

The Unit II lab required the development of a one-page course registration interface for ICT461. The page is required to use semantic HTML, responsive CSS and at least one JavaScript interaction. It also needs clear labels, keyboard-friendly controls and validation messages. DevTools evidence was required, specifically an Elements screenshot and a Network screenshot, together with Git history, accessibility checks and a short reflection.

2. Project Overview

The completed interface is a Course Registration System for Web Systems and Technology. The page provides a simple registration form containing the student's Full Name, Student ID, Programme and Course fields, followed by a Register button. The layout uses a centered form card with clear labels and consistent spacing.

3. Technologies Used

- HTML5 – used to structure the registration page and form elements.
- CSS3 – used for the layout, spacing, typography, borders, button styling and responsive presentation.
- JavaScript – used to provide form interaction/validation.
- Microsoft Edge Developer Tools – used to inspect the HTML/CSS and check browser-side behaviour.
- Git/GitHub – intended for version history and submission evidence.

4. Interface Implementation

The interface contains a main heading, a short description and a registration form. The form uses text input fields and select controls for structured data entry. The labels shown on the page make the purpose of each control clear. The Register button provides the main user action.

5. Accessibility and Usability Checks

- Form controls have visible labels such as Full Name, Student ID, Programme and Course.
- Text and controls are presented in a simple top-to-bottom order, making the form easy to follow.
- Input fields and select boxes are standard HTML controls that can be reached using the keyboard.
- The button has a clear action label: Register.
- Validation should provide a clear message when required information is missing before registration is accepted.
- The page uses a responsive, card-style layout so the form can fit different screen sizes.

6. DevTools Evidence – Elements

The Elements inspection confirms that the page is built from HTML elements including the main section, header, heading, paragraph and registration form. The selected h1 element is shown in the screenshot, and the Styles panel shows CSS rules applied to the heading.

Figure 1: Microsoft Edge DevTools – Elements inspection of the Course Registration page.

7. DevTools Evidence – Console Check

The second supplied DevTools screenshot shows the Console. It records a local file URL security/origin message while the page is opened directly from the file system (file:///). This is browser security behaviour associated with local files rather than proof that the form layout itself is broken.

Figure 2: Microsoft Edge DevTools – Console inspection supplied as supporting evidence.

8. Git History Evidence

Git history. The show that the project was saved in a Git repository and that changes were committed during development.

Figure 3: Git/GitHub commit screenshot

10. Assignment Evidence Checklist

Requirement	Evidence	Status
Working page	Course Registration interface screenshot	Completed
Git history	Git/GitHub commit screenshot	Add before submission
Accessibility checks	Labels, keyboard-friendly controls and validation review	Completed / verify
DevTools – Elements	Figure 1	Completed
Short reflection	Section 11	Completed

9. Reflection (approximately 300 words)

In this lab, I developed a one-page course registration interface for ICT461 using HTML, CSS and JavaScript. The main purpose of the interface is to allow a student to enter basic registration information, including full name, student ID, programme and course. I used HTML to create the structure of the page and form controls. I used CSS to improve the appearance by arranging the form in a clean card layout, adding spacing, borders and a clear Register button. JavaScript was used to provide interaction and validation so that the form can respond when the user tries to register without providing the required information.

One important lesson from the lab was the importance of semantic and accessible form design. Clear labels help the user understand what information belongs in each field, while normal HTML input and select controls support keyboard use. I also learned how browser Developer Tools can be used to inspect a webpage instead of only looking at the final visual result. In the Elements panel, I could see the HTML structure and the CSS rules applied to individual elements. The Console also helped me notice a browser message related to opening the page directly from a local file.

The lab also showed me that testing is an important part of web development. A page may look correct but still need checks for validation, accessibility, browser messages and network behaviour. I would improve my work by testing the registration form with both valid and invalid inputs, checking it at different screen sizes and capturing the required Network and Git history evidence. Overall, the exercise helped me understand how HTML, CSS, JavaScript and browser Developer Tools work together to produce and test a simple interactive webpage.

10. Conclusion

The lab produced a functional one-page course registration interface with a clear form structure and styled user interface. The supplied DevTools evidence demonstrates inspection of the HTML/CSS and Console.
